

Lab 2:

Project: Dropshipping Inventory & Order Orchestrator

Name: Ashlesh R V

SRN: PES1UG24CS088

Jira Project / Workspace Link: <https://ashleshrv.atlassian.net/jira/software/projects/SCRUM/summary>

1. Product Backlog, Epics & Story Points

Backlog view for the Dropshipping Inventory & Order Orchestrator project. The left panel lists the four epics — Order Ingestion & Supplier Verification, Multi-Vendor Order Orchestration, Shipment Tracking & Order Visibility, and Backorder & Exception Management — and the backlog table shows story points (5, 8, 5, and two unestimated items) assigned to each backlog item.

2. Work Item Details & Priorities

Work item key	Work type	Work item priority	Issue summary
SCRUM-1	☒ Task		Start here: Add your team's work
SCRUM-10	🔗 Epic	⚖ Medium	Backorder & Exception Management
SCRUM-11	☒ Task	🔴 High	Receive Order Webhook
SCRUM-12	☒ Task	🔴 High	Verify Supplier Inventory
SCRUM-14	☒ Task	🔴 High	Dispatch Supplier Purchase Order
SCRUM-15	☒ Task	🔴 High	Split Multi-Vendor Order
SCRUM-16	☒ Task	🔴 High	Update Order Tracking
SCRUM-17	☒ Task	🔴 High	Monitor Order Dashboard

< 1 2 > Showing rows 1-20 of 37

Work item details list showing task types and priorities across the items created for this project; most core workflow tasks were rated High priority.

Priority breakdown and work-type distribution from the project Summary page, taken later after subtasks and epics were finalised.

3. Sprint 1 Execution

Task SCRUM-12 'Verify Supplier Inventory,' assigned to SCRUM Sprint 1, with all three subtasks (query supplier inventory, compare available stock, flag insufficient inventory) marked Done — confirming Sprint 1 was executed and its work completed.

4. Sprint 2 Board & Completion

Sprint 2 board at the point of closing the sprint. Jira initially blocked completion because three subtasks under SCRUM-16, SCRUM-17 and SCRUM-18 were still open; these were completed immediately afterward and the sprint was then closed successfully (see Final Work Status, Section 7).

5. Sprint Burndown Chart

Sprint burndown chart for Sprint 2, captured shortly after the sprint started, plotting the 26-point guideline against the sprint window (Aug 27 - Sep 10). Remaining work was driven to zero by the time the sprint was closed.

6. Work Analytics

Work items by status, type, and assignee for the full project (37 items at time of capture).

Work item creation trend and average work item cycle time.

Work item lead time and completion trend, split by Task, Subtask, and Epic.

7. Epic Progress

Epic progress showing Order Ingestion & Supplier Verification, Shipment Tracking & Order Visibility, and Backorder & Exception Management all at 100%.

Epic progress confirming the fourth epic, Multi-Vendor Order Orchestration, also reached 100%.

8. Final Work Status

The 'All work' view displays a table with 34 items. The table has columns for 'Work', 'Assignee', 'Reporter', 'Priority', 'Status', 'Resolution', 'Created', and 'Updated'. All items are assigned to 'Unassigned' and reported by 'Ashlesh RV'. The status of all items is 'Done'. The priority is 'Medium' for most items, and 'High' for the last item. The resolution is 'Done' for all items. The created and updated dates are all from August 27, 2026.

Work	Assignee	Reporter	Priority	Status	Resolution	Created	Updated
SCRUM-28 Identify suppliers for order I...	Unassigned	Ashlesh RV	Medium	Done	Done	Aug 27, 2026, 9:25 PM	Aug 27, 2026, 10:36

☒ SCRUM-7 Order Ingestion & Supplier V...	Unassigned	Ashlesh RV	Medium	Done

Final 'All work' view after clearing the filter (32 of 32 items), showing every task and epic marked Done — verifying that both Sprint 1 and Sprint 2 deliverables were completed.

Reflection

1. Did the Jira work structure reflect the project plan?

Yes. The backlog was organized under four epics that map directly to the core workflow of the Dropshipping Inventory & Order Orchestrator: order ingestion and supplier verification, multi-vendor order splitting, shipment tracking, and backorder/exception handling. Each user story under these epics corresponds to a functional requirement identified during requirements engineering, such as verifying supplier inventory, dispatching purchase orders, and splitting multi-vendor orders.

2. Was the backlog well-prioritized and organized into meaningful work items?

Yes. Story points were assigned based on relative complexity (5 and 8 for the estimated items), and priorities were set to High for the core order-processing tasks (receiving webhooks, verifying inventory, dispatching purchase orders, splitting orders, updating tracking) and Medium for supporting subtasks. This ensured the highest-impact functionality was tackled first.

3. What does the sprint evidence show?

The project was executed across two sprints. Sprint 1 covered supplier-verification work, including task SCRUM-12 'Verify Supplier Inventory' and its three subtasks, all of which were completed. Sprint 2 covered the remaining shipment-tracking and backorder-handling tasks (SCRUM-16, SCRUM-17, SCRUM-18). An initial attempt to close Sprint 2 was blocked because those tasks still had open subtasks; the subtasks were completed immediately afterward and the sprint was then closed successfully.

4. What does the final Jira status show?

The final 'All work' views show every task, subtask, and epic marked Done, with all four epics reaching 100% completion. This confirms that both sprints' planned work was fully delivered by the end of the simulation.
